Significant Dokwe Exploration Update

Ariana Resources plc (ASX:AA2, AIM:AAU, "**Ariana**" or the "**Company**"), the mineral exploration, development and production company with gold project interests in Africa and Europe, is pleased to announce an exploration update for the 100% owned Dokwe Gold Project ("**Dokwe**" or "**the Project**") in Zimbabwe.

Highlights

- Exploration drilling commencing imminently at the Dokwe North and Dokwe Central areas and their extensions; regional exploration across the project area has outlined several additional targets.
- 10,086 soil samples collected for multi-element portable XRF ("pXRF") and detectORE™ gold analysis on a 50m by 100m grid across the entire project area totalling 44km^2.
- Drilling planned for follow-up of historical intercept of 7.3m @ 6.63g/t Au from 32.2m at the Sinkwe prospect.
- Drilling planned for follow-up of the historical intercept of 0.5m @ 81.09g/t Au from 243m at the Siduli Pan prospect.
- Gold mineralisation at Dokwe North, Central and Siduli Pan are hosted by shear zones which juxtapose distinct litho-structural domains, separating volcanic and sedimentary units.
- Prospective shear zones have a combined strike length of at least 12km within the project area and remain largely untested.

Dr. Kerim Sener, Managing Director, commented:

"Over the course of several months, the Dokwe site team have completed an extensive new soil geochemical programme over the entire project area, covering 44km^2 and undertaken on a tight grid. This work, in addition to an extensive assessment and re-processing of previous geological, geophysical and geochemical data, has resulted in a much-improved understanding of why the gold deposits at Dokwe North and Central are located where they are.

Major shear zones, which separate broadly ENE-WSW trending litho-structural domains comprising an alternating sequence of volcanic and sedimentary units, host the known mineralisation at Dokwe North and Central. Our mission is to now commence drill testing at certain locations along over 12km of strike of these shear zones in the broader project area. Given that there is over 1Moz of gold contained within only about 10% of this strike length, with the rest remaining essentially untested by drilling, suggests there may be considerable upside and discovery potential elsewhere in the project area.

We have already identified a number of target areas along these shear zones or their related structural splays, including the newly named Sinkwe, Wabayi and Mpunzi prospects, which have yielded anomalous gold grades in prior exploration. Some of these targets, along with the Siduli Pan prospect, are due to be tested in upcoming exploration drilling."

Background

The Dokwe Gold Project in Zimbabwe hosts the million-ounce Dokwe gold deposits, which are being progressed to a Feasibility Study ("FS"). Recent work on the Dokwe Project has resulted in significant developments in our understanding of the geological controls on the Dokwe North and Central deposits, implying that both zones of mineralisation extend beyond their currently defined limits (**Figure 1**). The potential for extending Dokwe North has been further enhanced by the discovery of a soil anomaly to the northeast of the deposit utilising pXRF and detectORE^{TM} analysis (RNS: 2 July 2025).

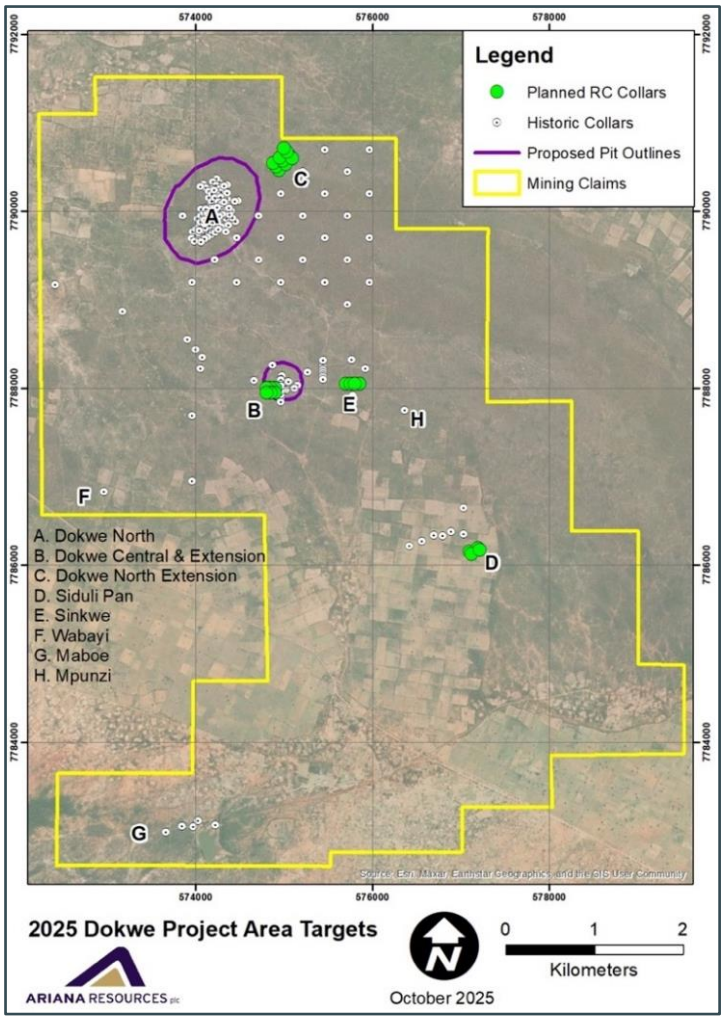

Figure 1: Areas of interest discovered to date within the Dokwe project area, highlighting the RC holes that are planned for the upcoming drilling programme.

In conjunction with this, the Ariana team continues to evaluate the prospectivity of the wider project area. A regional soil sampling programme has been completed, with 10,086 samples collected on a 50m by 100m grid across the entire project area, covering a total of 44km^2 (**Figure 2**).

These samples have all been analysed by multi-element portable XRF ("pXRF") and some with detectORE^{TM} analysis for gold. This has led to several new target areas being defined or known target areas further refined. A Reverse Circulation ("RC") drilling programme has been planned to test some of the highest priority targets.

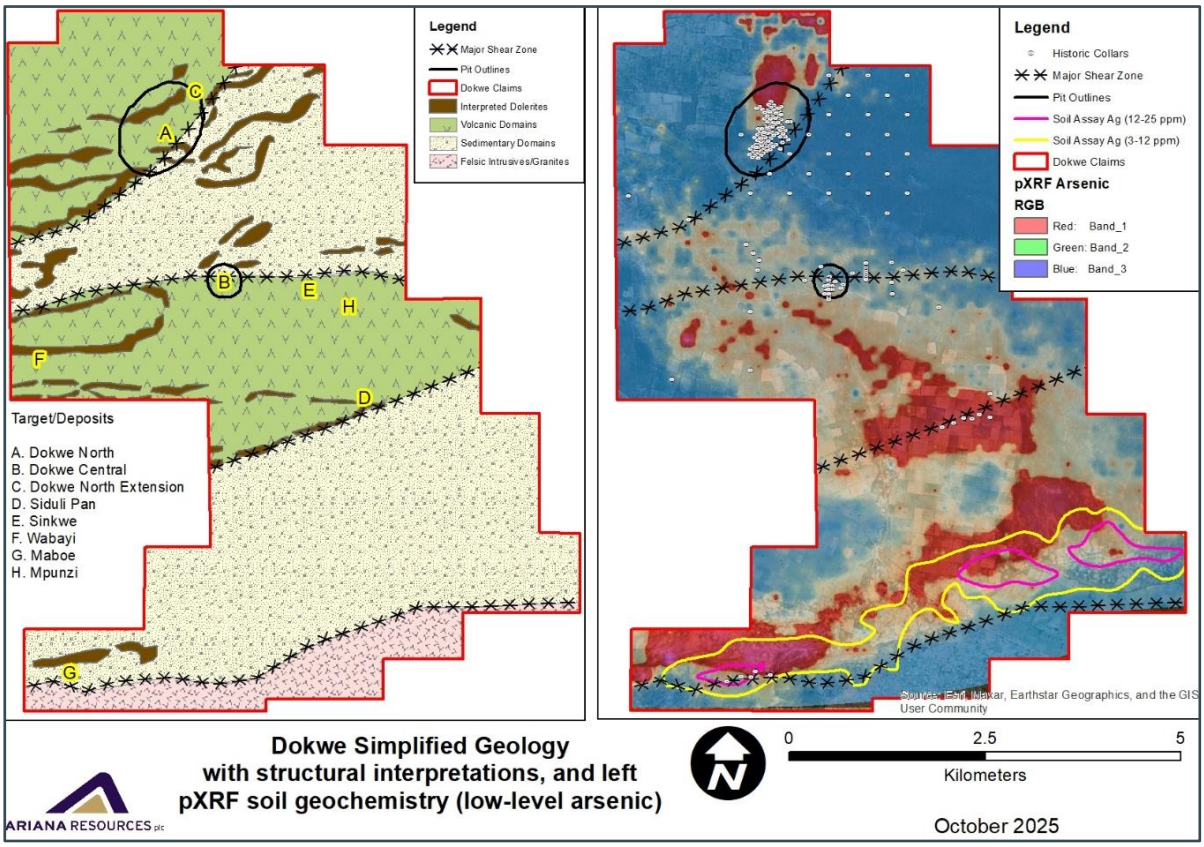

Figure 2: *Left:* Interpreted litho-structural domains and domain-bounding shear zones within the Dokwe project area. Note how the main gold occurrences (A, B, and D) are associated with the shear zones. *Right:* Geochemical heat map (arsenic), from the recently completed soil sampling programme. Note the major silver anomaly contoured at the southern end of the project area. The drill collars (white dots) highlight that a relatively short strike length of the shear zones has been drill tested.

Near-Mine Exploration Targets

Dokwe Northeast Extension Target

The Dokwe North deposit represents the majority of the current resources within the project area. The soil sampling programme identified an arsenic anomaly to the north east of the Dokwe deposit, which led to the discovery of a gold in soils anomaly using detectORE™. Ten holes have been planned to test this initial target (**Figures 1 & 3**).

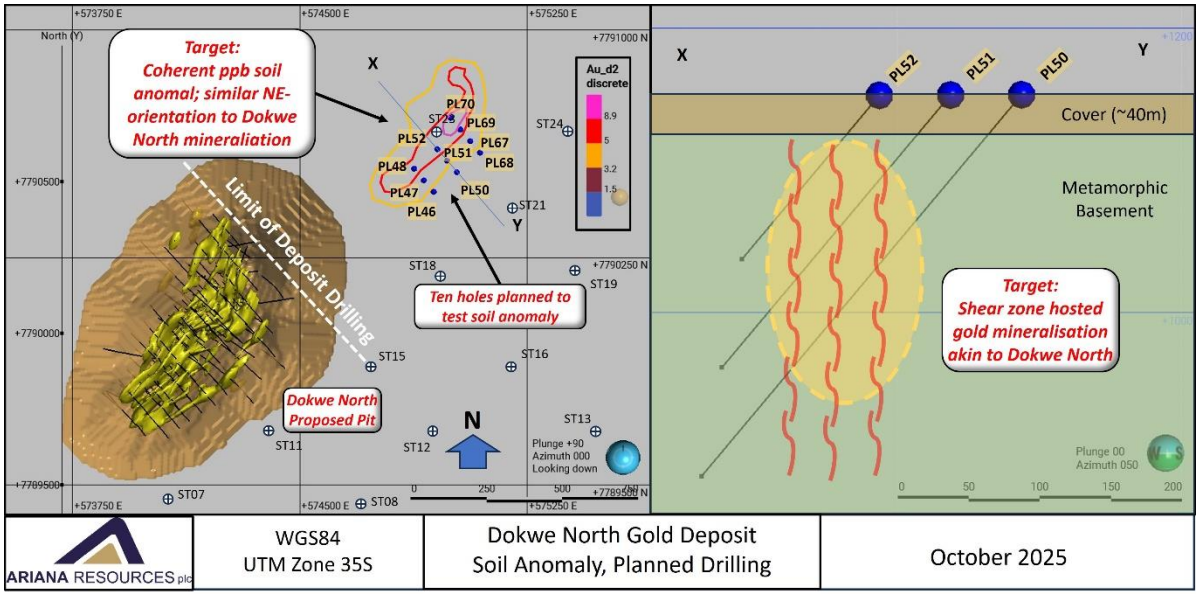

Figure 3: Dokwe Northeast Extension soil anomaly *(left)* and planned RC drill holes *(right)*.

Dokwe Central Western Extension Target

At Dokwe Central, the geology appears to be offset at the western end of the deposit (**Figure 4**). The reinterpretation of historical drilling indicates that the Central Shear Zone and the mineralisation appear to have been faulted southwards at the western end of the resource (**Figures 4 & 5**).

There is no drilling in this area, and this presents an excellent opportunity to extend mineralisation westwards along the Central Shear Zone, and is a high-priority target that will be drilled in the upcoming programme. Furthermore, anomalous drilling results at several locations away from these deposits have not been adequately tested.

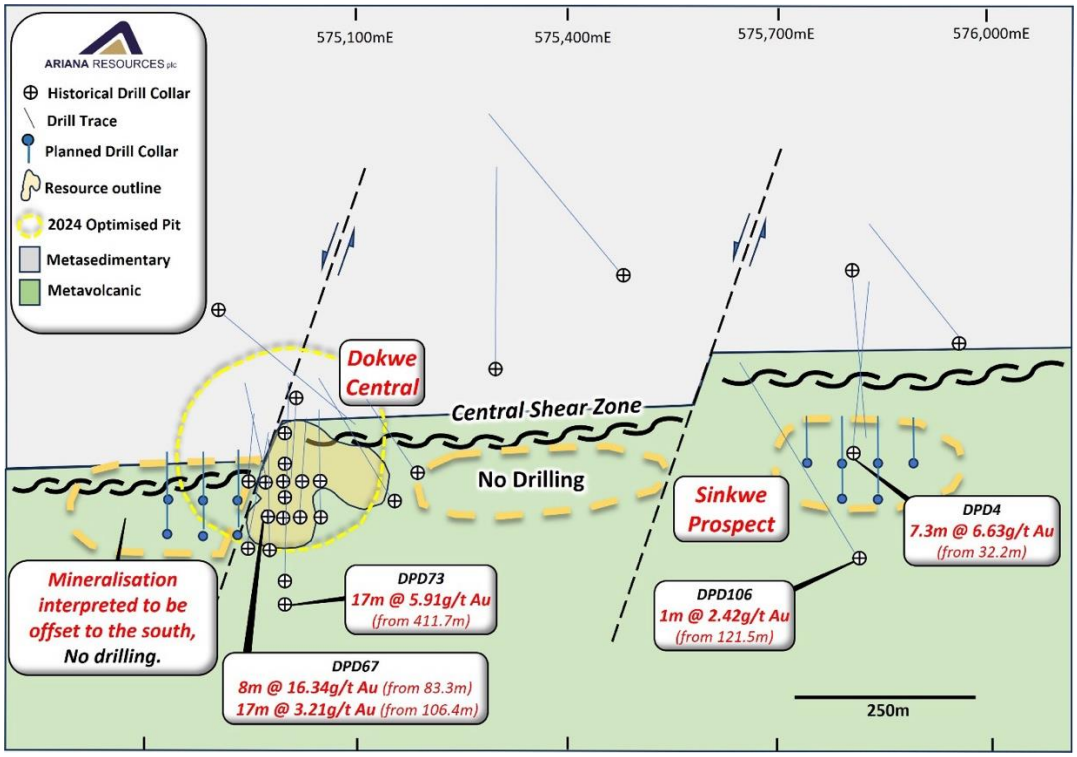

Figure 4: Central Shear Zone showing structural offsets, and the targets to the west of the Dokwe Central deposit. The drilling planned at the Sinkwe Prospect is also shown to the east.

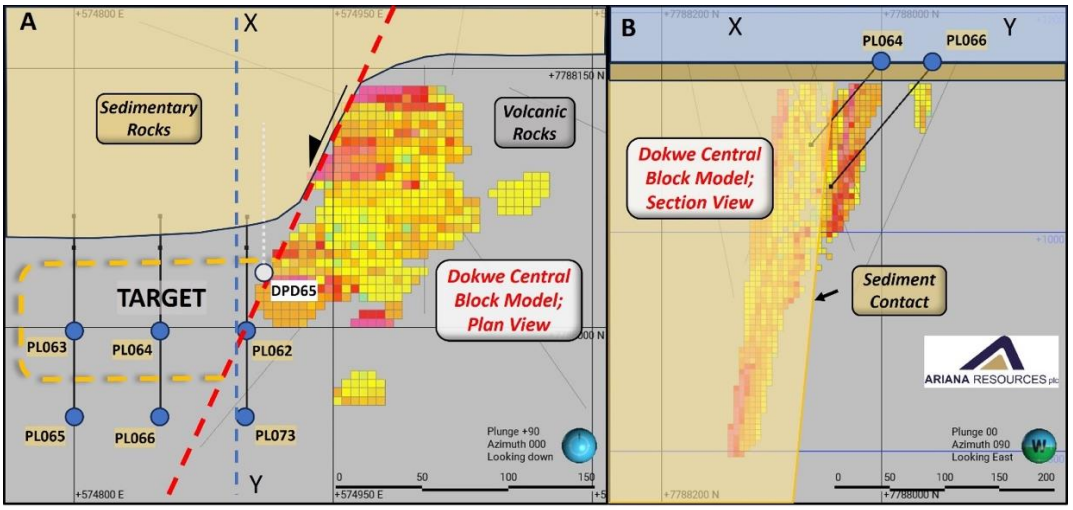

Figure 5: Dokwe Central deposit, plan view (A), and cross section X-Y (B). Note how the western cross-fault appears to have displaced the geology southwards along the western margin of the deposit. There are currently no drill holes to test whether the mineralisation has also been offset.

Regional Exploration Targets

Further afield from the two main deposits, several indications of gold mineralisation have either not been adequately followed up or not followed up at all.

Sinkwe Prospect

Approximately 750m eastwards from Dokwe Central along the Central Shear Zone, a historical drill hole, DPD4, intercepted **7.3m @ 6.63g/t Au** from 32.2m depth (**Figure 6**). The drill core at this shallow depth is heavily weathered; however, chips of rock can be observed, which show a strong similarity to the mineralised breccia at Dokwe Central. The mineralised zone is also enriched in zinc, akin to Dokwe Central. This is a priority target, and a pattern of RC drill holes are planned (**Figures 4 & 6**) to test the strike and depth extents of the target.

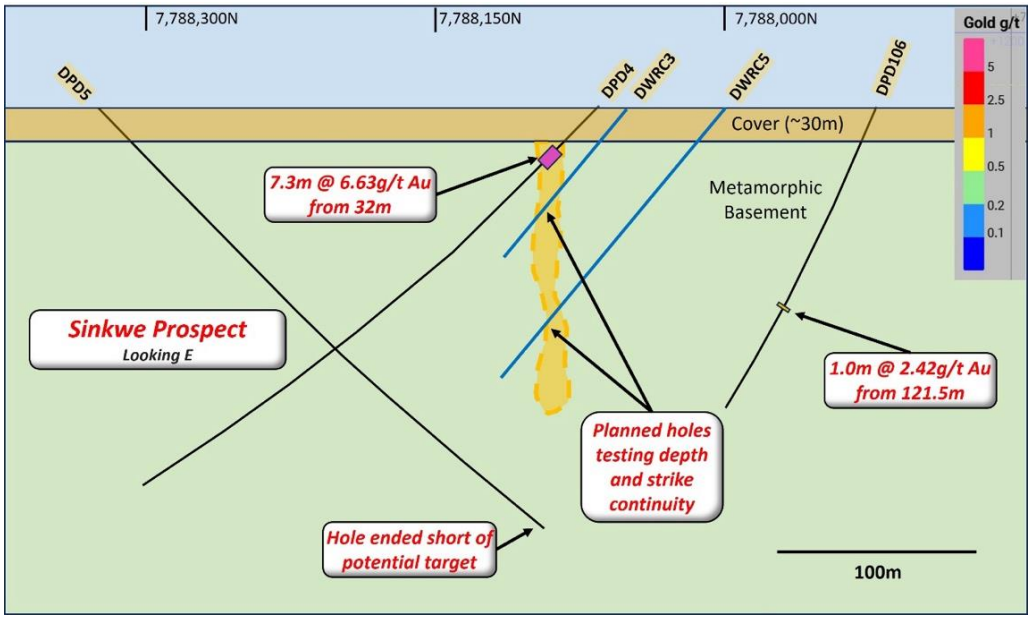

Figure 6: Cross-section through the Sinkwe Prospect, showing historical drilling and planned holes.

Siduli Pan Prospect

The Siduli Pan prospect is located ~2.5km southeast of Dokwe Central and was the target of a historical geophysics and drilling programme undertaken by Pexmin from 2017 to 2019. Ariana has re-evaluated the historical drill core (SD1-SD5, DSD01 & DSD02), using the results of pXRF geochemistry and geophysics.

This work highlights the presence of magnesium-chrome-nickel-rich ultrabasic intrusive units, which are the only known occurrence of such rocks in the project area, suggesting a different geological domain, juxtaposed by the Siduli Shear Zone.

The Siduli Shear Zone represents a subvertical structure, with intensely sheared shales, chlorite schists and mylonites over a width of at least 300m, which can be traced along strike for more than 30km, using aeromagnetic data.

DSD02 intercepted **0.5m @ 81.09g/t Au** from 243m down hole depth, within the mylonitic ultrabasic unit and close to the contact with an adjacent chlorite schist. The intercept is isolated and has not been followed up, making Siduli Pan a high-priority target for mineralisation at shallower depths up dip and along strike of this intercept (**Figures 7 & 8**).

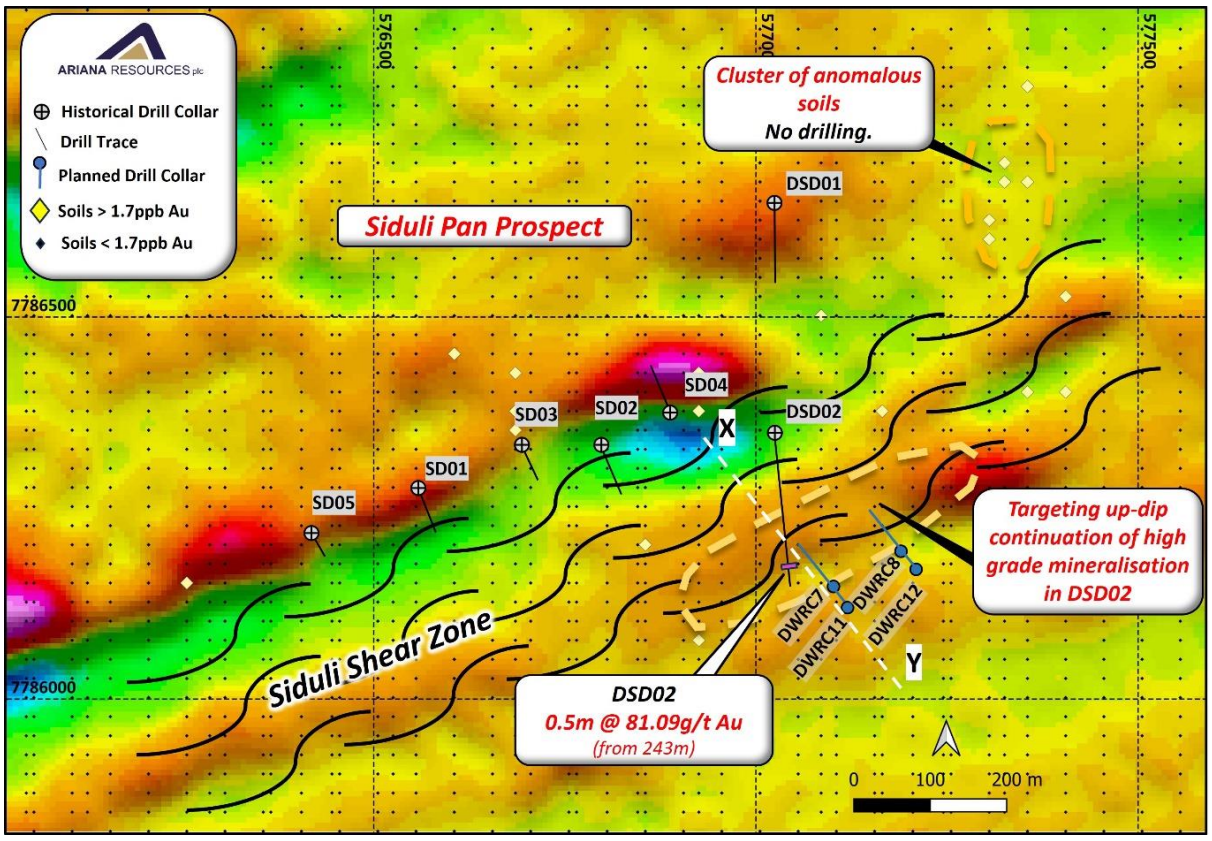

Figure 7: Aeromagnetic image of the Siduli Pan prospect, where anomalous soil samples appear to be spatially related to the Siduli shear zone. A historical hole, DSD02, intercepted 0.5m @ 81.09g/t Au from 243m. The planned holes will test the up-dip continuation of this intercept between 50m and 100m depth. The cluster of anomalous soils in the northeast is outside of the licence previously held by Pexmin and remains untested.

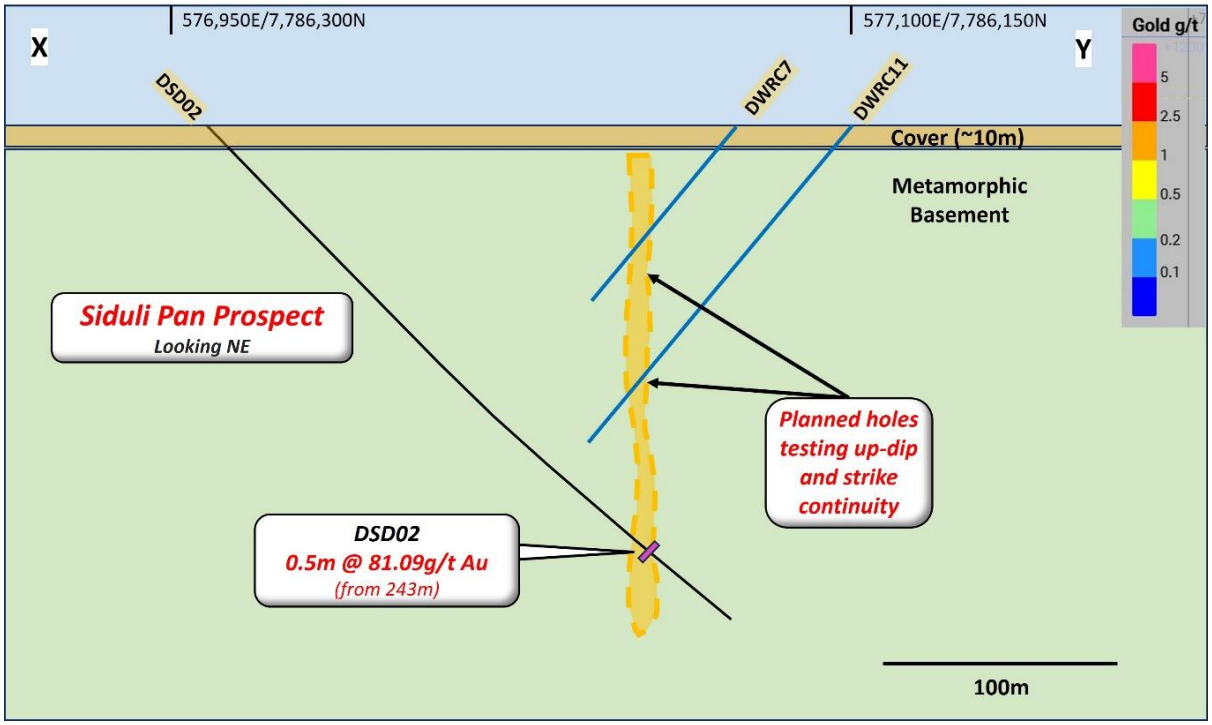

Figure 8: Cross section along X-Y in Figure 7, showing the Siduli Pan target up-dip from the high-grade intercept in DSD02.

Wabayi Prospect

The Wabayi prospect is ~2km WSW of Dokwe Central (**F in Figures 1 and 2**). The volcanic geology comprises andesite, with sections showing pillow textures indicative of a submarine depositional environment. Metre-scale layers of phyllite are interbedded within the volcanic rocks. The rocks have undergone significant strain and greenschist facies metamorphism. Three very widely spaced holes were drilled within the project area, NK17, 19, and 20 (**Figure 5**). An intercept grading **1.1m @ 0.32g/t Au** from 211.6m in NK20 relates to a quartz vein with pyrite. It is an isolated drill hole, and mineralisation such as this is of considerable interest and warrants further investigation.

Mpunzi Prospect

A single drill hole, DPD20, was drilled approximately 1.5km ESE of Dokwe Central (**H in Figures 1 and 2**). DPD20 was drilled vertically to a depth of 562 metres. The metamorphic basement rocks comprise chlorite schist and biotite schist to a depth of 380m. The foliation and schistosity are sub-parallel to the core axis, indicating they are sub-vertical. At 380 metres, the schists are intruded by ~200m of medium to coarse-grained post-Archaean dolerite. Sporadic 20 to 30cm

samples were taken, with several samples returning indications of subtle mineralisation, including **0.46g/t Au** from 26.3m, and **0.37g/t Au** from 36.3m.

Dokwe South

At the southern end of the claims area, the cover thins and outcrop begins to emerge, revealing portions of a sheared granite greenstone contact. At the Maboe prospect (**G in Figures 1 and 2**), just north of the contact, a sub-cropping quartz-vein breccia forming an east-west ridge with an intermittent strike of approximately 600 metres was discovered (**Figure 9**).

A rock-chipping programme returned several anomalous silver assays. Work is ongoing to reconcile the silver in the breccia with a highly significant silver-in-soils anomaly that appears to transect the southern end of the claims area (**Figure 2**), and what that means for the prospectivity of the southern shear zone.

Summary

Expanding the soil geochemistry and combining it with the geophysics and drilling is already advancing our understanding of the geology and prospectivity within the project area, and defining several distinct litho-structural domains juxtaposed by major shear zones. Three of these shear zones, totalling some 12km strike, host gold mineralisation, yet they remain unexplored beyond the main deposits at Dokwe North and Central.

The majority of historical drilling in the project area has been focused on the Dokwe North and Central deposits. Both Dokwe North and Central show indications that they can be further extended into areas that have not been drill-tested previously. A few relatively shallow drill holes are currently considered sufficient to confirm this understanding.

It is encouraging that of the few holes drilled beyond the known prospects, two have intercepted high-grade gold (DPD4 and DSD02), whilst two others have intercepted subtle mineralisation (NK20 and DPD20). These exciting, high-priority targets have either been inadequately followed up, or not followed up at all.

Dokwe Mineral Resource Estimate

Table 1: In-pit Mineral Resource Estimate for the Dokwe Gold Project.

PROJECT	CLASSIFICATION (REPORTING CUT-OFF GRADE 0.3g/t Au)	TONNAGE (t)	GRADE (g/t Au)	CONTAINED GOLD (oz)
Dokwe North	Measured	17,309,000	1.06	592,000
	Indicated	18,562,000	0.90	537,000
	Inferred	7,095,000	0.82	187,000
	Total	**42,966,000**	**0.95**	**1,316,000**
Dokwe Central	Indicated	1,811,000	1.60	93,000
	Inferred	120,000	1.69	7,000
	Total	**1,931,000**	**1.61**	**100,000**
Total	Measured	17,309,000	1.06	592,000
	Indicated	20,373,000	0.96	631,000
	Inferred	7,214,000	0.83	193,000
TOTAL		**44,896,000**	**0.98**	**1,416,000**
PROJECT	**CLASSIFICATION (REPORTING CUT-OFF GRADE 0.6g/t Au)**	**TONNAGE (t)**	**GRADE (g/t Au)**	**CONTAINED GOLD (oz)**
Dokwe North	Measured	10,220,000	1.50	493,000
	Indicated	8,260,000	1.50	399,000
	Inferred	3,123,000	1.33	134,000
	Total	**21,604,000**	**1.48**	**1,025,000**
Dokwe Central	Indicated	1,207,000	2.19	85,000
	Inferred	98,000	1.98	6,000
	Total	**1,306,000**	**2.18**	**91,000**
Total	Measured	10,220,000	1.50	493,000
	Indicated	9,468,000	1.59	484,000
	Inferred	3,222,000	1.35	140,000
TOTAL		**22,909,000**	**1.52**	**1,116,000**

Notes:

1. The Dokwe Mineral Resource Estimate is reported in accordance with the JORC Code. Reported using cut-offs grades of 0.3g/t Au and 0.6g/t Au As at 4 March 2025.
2. Refer to sections 4.8.5 and 4.8.6 of the IGR for further information regarding the Dokwe Mineral Resource Estimate including information required by ASX Listing Rule 5.8.
3. The Dokwe Mineral Resource Estimate is inclusive of Reserves.

Compliance Statements

The information in this announcement relating to Mineral Resources and Ore Reserves has been reported by the Company in accordance with the 2012 Edition of the 'Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves' (**JORC Code**) previously (refer to the Company's replacement prospectus which was released to the ASX market platform on 8 September 2025 (**Prospectus**) and is available on the Company website at http://www.arianaresources.com/) (**Previous Market Announcement**).

The Company confirms that it is not aware of any new information or data that materially affects the information included in the Previous Market Announcement and, in the case of estimates of Mineral Resources and Ore Reserves, that all material assumptions and technical parameters underpinning the estimates in the Previous Market Announcement continue to apply and have not materially changed.

The information in this announcement that relates to the Dokwe PFS production target, or the forecast financial information derived from that production target was first reported on the ASX in the Previous Market Announcement. The Company confirms that all the material assumptions underpinning the production target, and the forecast financial information derived from the production target, in the Previous Market Announcement continue to apply and have not materially changed.

Competent Persons Statement

The information in the Investment Overview Section of the prospectus (included at Section 3), the Company and Projects Overview (included at Section 5), and the Independent Geologist's Report (included at Annexure A of the prospectus), which relate to exploration targets, exploration results, mineral resources, Ore Reserves and forward looking financial information is based on, and fairly represents, information and supporting documentation prepared by Alfred Gillman, Ruth Woodcock, Izak van Coller, Hovhannes Hovhannisyan (together, the JORC Competent People), and Richard John Siddle, Andrew Bamber and Daniel Van Heerdan (together, the Qualified People). Refer to the Independent Geologist's Report for further information in relation to the information compiled by each of the JORC Competent People and the Qualified People, their professional memberships, their relevant qualifications and experience and their relationship with the Company.

The Company confirms that the form and context in which the Competent Persons' findings are presented have not been materially modified from the Previous Market Announcement.

Forward looking statements and disclaimer

This announcement contains certain "forward-looking statements". Forward-looking statements can generally be identified by the use of forward looking words such as "forecast", "likely", "believe", "future", "project", "opinion", "guidance", "should", "could", "target", "propose", "to be", "foresee", "aim", "may", "will", "expect", "intend", "plan", "estimate", "anticipate", "continue", "indicative" and "guidance", and other similar words and expressions, which may include, without limitation, statements regarding plans, strategies and objectives of management, anticipated production dates, expected costs or production outputs for the Company, based on (among other things) its estimates of future production of the Projects.

To the extent that this document contains forward-looking information (including forward-looking statements, opinions or estimates), the forward-looking information is subject to a number of risk factors, including those generally associated with the gold exploration, mining and production businesses. Any such forward-looking statement also inherently involves known and unknown risks, uncertainties and other factors that may cause actual

results, performance and achievements to be materially greater or less than estimated. These factors may include, but are not limited to, changes in commodity prices, foreign exchange fluctuations, general economic and share market conditions, increased costs and demand for production inputs, the speculative nature of exploration and project development (including the risks of obtaining necessary licenses and permits and diminishing quantities or grades of reserves), changes to the regulatory framework within which the Company operates or may in the future operate, environmental conditions including extreme weather conditions, geological and geotechnical events, and environmental issues, and the recruitment and retention of key personnel.

- ENDS-

The Board of Ariana Resources plc has approved this announcement and authorised its release.

About Ariana Resources plc:

Ariana is a mineral exploration, development and production company dual listed on AIM (AIM: AAU) and ASX (ASX: AA2), with an exceptional track record of creating value for its shareholders through its interests in active mining projects and investments in exploration companies. Its current interests include a major gold development project in Zimbabwe, gold-silver production in Türkiye and copper-gold-silver exploration and development projects in Kosovo and Cyprus.

For further information on the vested interests Ariana has, please visit the Company's website at www.arianaresources.com.

JORC Table 1 – Dokwe

Section 1 Sampling Techniques and Data
(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of*	• Soil samples were collected from 15cm deep pits, screened to -1mm, on lines 400m apart with 50m samples composited over 400m. The samples were analysed by Intertek Genalysis in Perth Australia using their partial extraction method (TL1) to determine Au, Ag, As, Co, Cu, Sb by ICP-MS. Sampling was carried in the Regional, Intermediate, follow-up and Detailed phases. For regional samples +-2kg samples were collected and sent to Peacock & Simpson & Associates laboratory in Harare for heavy mineral concentration, and the concentrate sent to Intertek Genalysis laboratory in Perth. Intermediate, follow-up, and detailed samples were passed through a -1mm sieve, and +-100g of the fine sample was sent to Intertek Genalysis. There was no QA/QC on the soil analyses apart from internal lab checks. • Portable XRF analysis for approximately 40,000 readings was taken across 138 archived diamond drill holes. Readings were taken at 1m intervals directly onto cleaned core surfaces. The results obtained were used to identify relative geochemical characteristics of the Dokwe geology. The pXRF unit used was an Olympus Vanta. QA/QC samples were utilised at the start of each session and then at approximately every 100 readings. • Portable XRF analysis for a total of 10,086 soil samples were collected across the tenement area. Samples were collected on a grid of 50 m by 200 m, reducing spacing to 50 m by 100 m in areas of priority interest. Once the soil sample is dry, a pXRF reading is taken from the soil sample to obtain multi-element geochemistry. The pXRF unit used was an Olympus Vanta. QA/QC samples were utilised at the start of each session and then at approximately every 100 readings. • Next, a 250g sub-sample is weighed and placed into a plastic pouch with 500ml of reagent added and a collector device (CD) attached to the inside of the cap of the pouch. The pouches are placed in a barrel and tumbled for 12 hours. After this, the pouches are removed from the drum and CDs are removed from the pouches, rinsed gently in water and dried in a dehydrator oven for three hours. This detectORE™ technology has been used to analyse 811 of the pXRF soil samples from priority areas.

Criteria	JORC Code explanation	Commentary
	detailed information.	
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Diamond drillholes were collared with HQ core size (63.5mm diameter) to a more competent ground and then continued with NQ core size (47.6mm diameter) to the end of drillhole. Some drillholes drilled between 2003 and 2007 were drilled with narrower BQ core size (36.4mm diameter). The diameter of the percussion drillholes was 152mm. Diamond drillholes drilled in 2020 for metallurgical purposes were collared with PQ core size (85mm) to more competent ground and then continued with HQ core to the end of hole and the diameter of sterilisation percussion drillholes was 133mm. Diamond drillholes drilled in 2023-2024 for due diligence purposes were predominantly drilled using standard HQ drill rods. However, some holes were collared with PQ-sized rods to approximately 100m. Deeper holes (>250 metres), were drilled to final depth using NQ rods after HQ (DPD132). • The drill core since 2019 was oriented using the Boart Longyear TruCore™ UPIX core orientation system. The NQ core was oriented but highly weathered and broken HQ core was not oriented. The whole of the geotechnical drillhole core was oriented. The due diligence drillholes (DPD129 - DPD132) core were oriented.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Drillhole recoveries were measured during each diamond drilling campaign and a total average recovery of 94% was achieved for the diamond drillholes to 2020, whereas 73% was achieved for the 2021 sterilisation percussion drillholes. However, recovery data pertaining to the percussion drillholes (32 drillholes) and five additional diamond drillholes drilled between 2003 and 2004 were not available at the time of reporting. Recovery for the 2023-2024 programme was 98.62%. • The sample recoveries were maximised through drilling techniques and consistent monitoring. • Sample recoveries versus grade relationships were not assessed. It is the CP's opinion that there is no bias with respect to drilling technique and sampling methodology utilised.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is*	• All drillholes drilled on Dokwe Project were logged geologically and the logging included "from" and "to" depth, lithology, colour, grain size, weathering, oxidation, and mineralisation. • All drillholes have been geologically logged to a level of detail to support Mineral Resource estimation. • Drillhole logging is qualitative in nature. During the 2019 drilling, the diamond drill core was also photographed both wet and dry at the drill site and photos. • All diamond core and percussion chips were completely logged from the top to the bottom of drillhole including all intersections.

Criteria	JORC Code explanation	Commentary
	qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • *The total length and percentage of the relevant intersections logged.*	
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• During sampling, samples were marked at 1m intervals apart from where the sampling crossed lithological boundaries where each side of the lithological contact was sampled separately. • After logging and marking of samples, the diamond drill core was then split in half by a diamond saw with one half stored for future reference and the other half core was sent to the laboratory for analyses. • Diamond drill core was logged from the top to the bottom of the drillhole including all the intersections, after logging, the drill core was marked for sampling by a senior geologist. The core was sampled nominally in 1m length apart from where sampling crossed lithological boundaries where each side of the boundary was sampled separately. Drill core was split in half with a diamond saw with one half core sample bagged in a plastic bag and then sent to the laboratory and the other half was retained in the core trays. In most drillholes, the entire core was sampled apart for the younger sedimentary cover. In later drillholes, only the mineralised portions of the drill core were sampled. • During percussion drilling, samples were collected every 1m into a large plastic bag and then split using a riffle splitter to desired amount for the laboratory analysis. • Sample representativity was tested by taking field duplicates and internal laboratory duplicates. • Sample size is in line with international practice and is appropriate to the grain size of the material being sampled.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers,*	• Sample analyses were carried out at Antech, SGS Lakefield Research Africa, Intertek Genalysis Laboratories and ALS Global in South Africa. • Sample preparation at Antech laboratories involved drying the sample, crushing, pulverising, riffle splitting, and packaging. A small portion of the pulverised material, 50g, was analysed for gold by fire assay with atomic absorption ("AA") finish. • At Intertek Genalysis South Africa, the sample preparation

Criteria	JORC Code explanation	Commentary
	handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	involved drying the sample, crushing, pulverising, riffle splitting, and packaging. After going through the sample preparation stages, the final sample for analysis weighed approximately 50g and was shipped to Australia for analysis. All samples were assayed for gold by 50g fire assay with optical emission spectrometers ("OES") finish. • Details pertaining to the analytical procedure at SGS Lakefield Research Africa was not available at the time of reporting. • Analytical techniques utilised at the laboratories are considered total. • No assay methods other than those conducted at the accredited laboratory (Antech, Intertek Genalysis, SGS Lakefield Research Africa Laboratory), were utilised in the generation of the Dokwe sampling database. Note that the details pertaining to the accreditation status for SGS Lakefield Research Africa Laboratory was not available, however, this data was not used in the MRE work outlined here. • Between 2003 and 2007, blanks and duplicates were inserted into the sampling sequence. Between 2008 and 2011, CRMs, blanks and duplicates were inserted into the sampling sequence. • During 2019 and 2020 sampling campaigns, the QA/QC protocol for insertion of QA/QC samples was that one in every 10th sample sent to the laboratory will either be a blank or one of the four CRM. • During the 2023 sampling, every batch of 34 samples sent to Antech included 1 CRM, 1 blank, 1 field duplicate and 1 pulp duplicate. • An adequate number of control samples were utilised during core sampling. • During Ariana's 2023 due diligence review of the Dokwe Project approximately 10% of samples extracted from DPD129 (Dokwe North) and DPD131 (Dokwe Central) were duplicated as quarter core and sent to ALS Global in South Africa for check analysis against the Antech laboratory in Zimbabwe. Results are satisfactory. • pXRF readings are taken on diamond drill core using a 3-beam Vanta M Series (VMR) with test timings set to Beam 1: 30s – Beam 2: 20s – Beam 3: 20s. Soil samples for pXRF are collected and air dried prior to analysis. Test timings for soils are set to Beam 1: 40s – Beam 2: 30s – Beam 3: 30s. For all pXRF analyses the unit is calibrated (cal check) at the start of the session. Following this, other QA/QC samples (blank, CRM, calibration disc) were utilised at the start and end of each session and at approximately every 100 readings. • For detectORE™ analyses, each batch of 90 samples contains two reference materials supplied by Portable PPB which are processed

Criteria	JORC Code explanation	Commentary
		and analysed in the same way as the other samples. The reference materials are not certified but have known concentrations of gold. They are used to check that the leach and collection process has worked as intended for that batch. In addition, two blanks and two field duplicates were included in every 90 samples. The pXRF detectORE™ mode is firmware installed on portable XRF devices to allow detection of gold values from the CD's, controlled via API coupled to pLIMS™ software that also manages the QA/QC. The pXRF detectORE™ mode is calibrated using five Calibrated Collector Devices of varying concentrations of gold from 0 to 1,000 ppb equivalent. Once dried, the CDs are analysed for gold using Evident's detectORE™ mode on a Vanta M Series (VMR) pXRF.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Dokwe North is an advanced exploration property that has a database with 101 diamond drillholes, 15 percussion drillholes and 25 sterilisation RC drillholes. • Less than 2km SE, Dokwe Central has 19 diamond drill holes and 5 percussion holes and has been audited by Digital Mining Services (DMS) in the past. Individual significant intersections were, therefore, not verified separately. In addition to the Dokwe North and Central holes 40 holes were drilled in prospects in the vicinity of Dokwe. • As part of verification, the QA/QC for the various drilling campaigns were reviewed and the drilling database was verified. • The original Dokwe drilling database was in the form of Microsoft Access database. The Dokwe drillhole database included 2003-2004, 2007, 2008, 2009, 2010, 2019 and 2020 drilling campaigns. The database was checked for duplicates, overlapping, and missing intervals, whilst all fields were checked for spurious or out-of-range values. • The database has been uploaded to MXDeposit as part of the Due Diligence study. • The Due Diligence drilling included a twin hole (DPD129), which correlated very well with its twin DPD49. • For detectORE™ analyses all samples and sample information are tracked using the bar codes on the pouches and the CD's. The sample numbers are entered into proprietary pLIMS™ software, Portable PPB's software interface for sample management and results. The barcodes prevent manual errors in data entry. • For detectORE™ analyses the gold concentration is calculated based on the weight of the original sample and moisture content, and the amount of gold on the CD (i.e., gold leached into solution). The gold concentration is given as dU (detectORE™ units), where a dU represents the leached and collected gold in micrograms of gold. This is a partial extraction, not a total gold result. The laboratory results from the trial batches are compared to the

Criteria	JORC Code explanation	Commentary
		detectORE™ results, and a correlation coefficient is established. This equation is used to predict the ppm (g/t) values the dU correlates with, and thus help define samples to be analysed at a laboratory using conventional assay. The detectORE™ results when compared to fire assays also provide detailed geometallurgical insights and leach characteristics, further adding value to this process. • During pXRF analyses, samples are analysed in numerical order, and a sheet is completed to note the inserted QA/QC samples. These are digitised and combined with the data export from the pXRF on a daily basis. No adjustment is made to pXRF data for soils or core in the raw data set.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• The coordinate utilised for Dokwe is WGS84 Universal Transverse Mercator ("UTM") Zone 35 South. • All drillhole collars up to 2019 have been surveyed by qualified professional surveyors Drysdale and Associates using RTK GPS (3 – 5mm accuracy) which is linked to the national grid. The coordinates were provided in Universal Transverse Mercator ("UTM") on Cape Datum. The geotech, metallurgical and due diligence holes were located using hand-held GPS. • During 2019 and 2020 drilling programme, all drillholes were downhole surveyed at 6m intervals using Boart Longyear – TruShotTM digital survey tools. In order to obtain the complete survey of the holes, the surveys were done separately for the HQ and NQ diameter of the holes. Earlier drillholes (DPD001 – 010) were downhole surveyed at 50m intervals using Reflex EZ- Shot™ equipment. Subsequently drillholes were downhole surveyed with Reflex EZ-Shot (Reflex single shot) and DeviFlexi tools and were surveyed at 25m and from DPD060 to DPD084 the interval decreased to 4m to 6m. No downhole survey was carried out on the percussion drillholes and six diamond drillholes drilled between 2003 and 2004 as well as the sterilisation drillholes drilled in 2021. Downhole surveys were carried out for the 2023-24 drilling. • In 2016, Southern Mapping Company (Pty) Ltd, was contracted by Canister to carry out a LiDAR survey of the topography. This was tied into WGS84 with better than 10cm accuracy, non-ground points were filtered out and an orthophoto and topographical contours were generated at 0.5m contour intervals. • In 2023, a drone survey over the Dokwe North area captured 2,600 detailed 12-megapixel aerial images to produce a high- resolution (4cm/pixel) photogrammetry map. This was used to validate and locate all historic collars within the immediate Dokwe North area to within 1m accuracy.

Criteria	JORC Code explanation	Commentary
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Data spacing and distribution are sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource estimation and classification. • A 1m compositing interval was selected and applied to the de-surveyed drillholes. Composites were selected from all drill holes except sterilisation RC holes. **DOKWE NORTH** • A total of 141 drillholes (including percussion and geotechnical drillholes) have been drilled at Dokwe North. At Dokwe North, drillholes were systematically laid out on 15 section lines (approximately 320º azimuth) spaced 50m apart and the collars were also spaced at 50m along the section lines. • Of these 141 holes, a total of 25 sterilisation percussion drillholes were drilled on a square grid of 350m over the proposed waste dump, plant, heap leach, tailings dam, and solar farm sites to the southeast of Dokwe North. • The total metres drilled within the resource area (i.e. excluding sterilisation holes) is 32,727m (116 holes). **DOKWE CENTRAL** • A total of 24 drillholes (including percussion drillholes) have been drilled at Dokwe Central. At Dokwe Central, most drillholes were systematically laid out on 3 section lines (E-W azimuth) spaced 50m apart and the collars were also spaced at 25m along the section lines, resulting in an average of 30m between holes. • In the resource area there are 5,166m (24 holes).
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• Dokwe North drillholes were systematically laid out on a section line (approximately 320º azimuth) generally perpendicular to the strike and most of the drillholes were drilled towards the northwest to intersect the mineralised orebodies very close to normal relative to the reef plane. • At Dokwe Central, drillholes were systematically laid out on section lines (E-W azimuth) generally perpendicular to the strike and most of the drillholes were drilled towards the north to intersect the mineralised orebodies very close to normal relative to the reef plane. • Available information indicates that the drilling orientation would provide unbiased sampling of the mineralisation zones. • Due diligence drilling in 2023 drilled from various orientations to better test the mineralisation and confirm that the drilling has provided unbiased sampling. • The geotechnical drilling was also completed in various orientations.
Sample security	• *The measures taken to ensure sample security.*	• The core was then transported to the core yard for geological logging and sampling. After logging and marking of samples, the diamond drill core was then cut in half by a diamond saw with one half stored for future reference and the other half core was sent

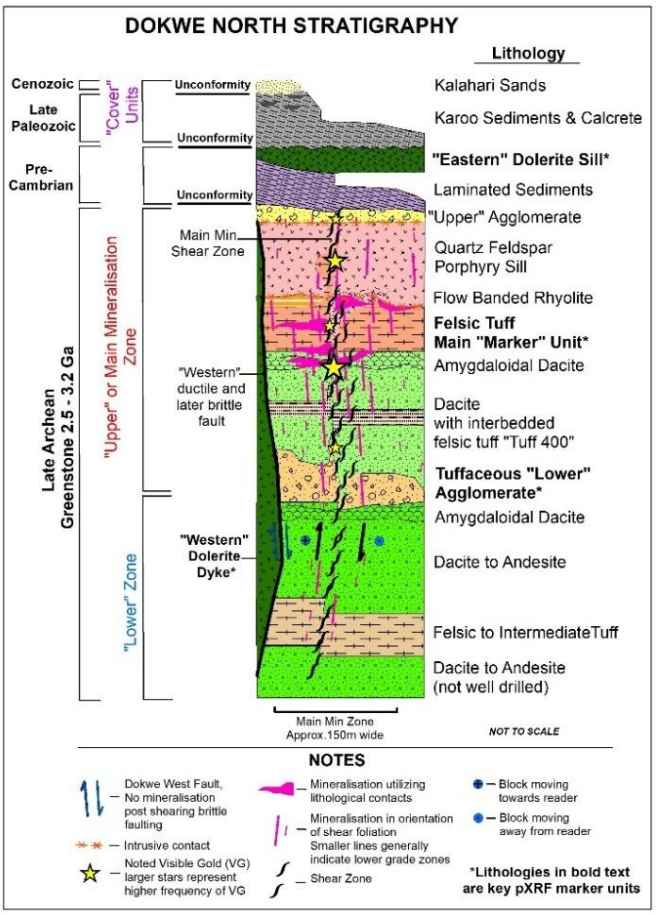
Criteria	JORC Code explanation	Commentary
		to the laboratory for analyses. • During percussion drilling, samples were collected in large bags and then split using a sample riffle splitter. After splitting, samples were bagged in plastic bags, the remaining bulk sample was transported to the main office about 125km from site and stored at a shed in the early years, but stored on site in the recent sterilization program. • All samples were transported by company personnel to the laboratory. They were signed off for dispatch from the core yard and on receipt to the laboratory. • All drill core is stored at the Dokwe Camp.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• In 2008 Digital Mining Services completed a data review and verification of the drilling results to date. • The sampling for the Due Diligence study has been supervised by the CP of this MRE.

Section 2 Reporting of Exploration Results
(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• Ariana owns 100% of the Dokwe Project following the all-share merger with Rockover Holdings Limited in June 2024. • Dokwe is held through 81 blocks of gold claims and 22 copper base metal claims totalling 4,040ha which are protected up until at least April 2026. The claims can be extended through annual inspection. Canister made application to the Ministry of Mines and Mining Development in March 2021 under Part VIII of the Mines and Minerals Act (MMA) to convert the claims into a Mining Lease with the aim is to facilitate the development of a significant new gold mine at Dokwe. The Mining Lease application is for gold and base metals, and the area applied for is 6,622ha. The Ministry requested additional information in support of the application which has been submitted. • The Project is currently not subjected to payment of royalties or other payments. Government royalties will be payable once mining operations are developed. A private royalty of 0.5% will also be payable once production starts. • As far as the CP is aware, no statutory instrument has been gazetted implementing an environmental fund as yet, so no fees are due or anticipated. In addition, the CP is not aware of any requests being made to Rockover by the Minister to implement an environmental fund. As such, no environmental rehabilitation trusts and guarantees have been established for Dokwe.

Criteria	JORC Code explanation	Commentary
		Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Acknowledgement is hereby made for the historical exploration conducted by Reunion Mining in 1993. Reunion Mining undertook a detailed airborne magnetic survey over an area of approximately 1,000km^2. The detailed airborne magnetic survey indicated the presence of an east-northeast trending linear magnetic feature buried beneath the younger sedimentary cover.
Geology	• *Deposit type, geological setting and style of mineralisation.*	**GENERAL DOKWE AREA** • The Dokwe gold deposits are situated in Archaean basement rocks buried by up to 40 metres of Karoo and Kalahari sedimentary cover. • The Dokwe area can be subdivided into a number of litho-structural domains which are juxtaposed against each other by a series of shear zones. The three known gold occurrences within the Claims Area are within shear zones, which have a combined strike length of approximately 12km. **DOKWE NORTH** • The geology of Dokwe North primarily consists of a sequence of Late Archean-aged greenstone volcaniclastics. These include dacite-to-andesite flows featuring amygdaloidal rich horizons, interbedded felsic tuffs, agglomerates, and irregular rhyolite flows. • The sequence is intruded by earlier quartz-feldspar porphyries and later altered dolerite. Brittle deformation, characterised by fracturing, is common in felsic tuff whilst more ductile deformation characterises dacite and andesite. • A major brittle fault, the “Western” fault is post-mineralised structure dissecting offsetting mineralisation.

Criteria	JORC Code explanation	Commentary



- The main Dokwe North orebody occurs within a NE-SW trending shear zone that displays a central core with intense foliation and mylonitisation of the host rocks.
- Primary gold mineralisation at Dokwe is preserved as free gold and occasionally as inclusions in quartz veins, micro-fractures in pyrite, and other open-space micro-features.
- The mineralisation is primarily structurally controlled and associated with the intensity of shearing and with lithological contacts. Visible gold has been documented multiple times and is often associated within the foliation planes formed by shearing.
- Overlying all the basement stratigraphy is a sequence of barren sedimentary rocks.

DOKWE CENTRAL

- Dokwe Central is higher-grade pipe-like deposit containing abundant quartz veins and several steeply plunging high-grade zones. Mineralisation is contained within a series of strongly sheared intermediate chlorite schists and biotite-chlorite schists in a covered Archean Greenstone Belt, extending from the border with Botswana

Criteria	JORC Code explanation	Commentary
		(Maitengwe Greenstone Belt) and linking up with the Bulawayo-Bubi Greenstone Belt to the east. The Archaean greenstone units are overlain by Karoo and Kalahari sedimentary units of up to 25-40m in thickness. • Mineralisation appears to be dominantly constrained within intensely sheared and brecciated zones, and in association with disseminated sulphides (dominantly pyrite). • The defined mineralisation extent is abruptly terminated against a package of sedimentary rocks to the north, marking a major east-west trending fault.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	**DOKWE NORTH** • Drillhole database consists of a total of 141 drillholes totalling 34,477m. The database is split with: ○ 101 diamond drillholes (incl. 5 geotechnical holes) totalling 31,286m. ○ 15 percussion drillholes totalling 1,441m. ○ 25 RC sterilisation holes totalling 1,750m. **DOKWE CENTRAL** • Drillhole database consisted of a total of 24 drillholes, totalling 5,166m. The database is split with: ○ 19 diamond drillholes totalling 4,816m. ○ 5 percussion drillholes totalling 350m. • All information is included in the Collar Table of this announcement.
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting*	• The sample intervals from the raw de-surveyed drillhole dataset were analysed for the most appropriate composite length to be applied for geostatistical analysis. The mean of the population is 1.13m, with approximately 75% of the population being exactly 1m in length. Given the data, a 1m compositing interval was selected

Criteria	JORC Code explanation	Commentary
	of high grades) and cut-off grades are usually Material and should be stated. • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	and applied to the de-surveyed drillholes. Composites were selected from all drill holes, except RC sterilisation drilling data. • No metal equivalents were calculated.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• At Dokwe North, drillholes were systematically laid out on section lines (approximately 320º azimuth) generally perpendicular to the strike, and most of the drillholes were drilled towards the northwest to intersect the mineralised orebodies very close to normal relative to the structural plane. • At Dokwe Central, drillholes were systematically laid out on section lines (E-W azimuth) generally perpendicular to the strike and most of the drillholes were drilled towards the north to intersect the mineralised orebodies very close to normal relative to the reef plane. • Downhole true widths are not calculated. All significant grades presented represent the value attributable to the real sample length and not corrected true width.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• All relevant diagrams pertaining to sampling type and its distribution, as well as geological and block models are presented in their respective sections and have been generated in accordance with the guidelines described in the JORC Code.

Criteria	JORC Code explanation	Commentary
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• The Mineral Resource Estimate is based on the information resulting from sampling and drilling campaigns. This Mineral Resource estimation summary contains information for all sampling and drilling campaigns within the Project Area to date. • All material intercepts are included in the Intercepts Table in this announcement.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Exploration works other than drilling conducted by or on behalf of the issuer includes soil geochemistry, geophysical survey (induced polarisation survey, real section induced polarisation, magnetic survey), and lidar survey. Some of this data has been incorporated into the Mineral Resource Estimation work completed here. • Soil geochemistry surveys have been completed in the periphery of Dokwe North and at the Dokwe Central prospect. A total of 10,086 samples have been collected to date. detectORE™ technology has been used to analyse 811 of these samples in the first instance. • pXRF soil sampling grid.

Criteria	JORC Code explanation	Commentary
		 • detectORE™ soil sampling grid.

Criteria	JORC Code explanation	Commentary
		Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Further exploration will be carried out in the region, particularly exploring the downdip of Dokwe North. Additional target areas defined previously will also be followed up. • pXRF work is ongoing across all Dokwe North drillholes, and is being used in the geological modelling. Approximately 40,000 readings have been taken to date. • Follow up of significant grades intercepted in DPD004 approximately 800m east of Dokwe Central. • Exploration drilling at Dokwe North and Dokwe Central extensions.

NOTE: Sections 3 and 4 aren't provided here as no mineral resources or ore reserves are being reported. Section 5 is not relevant to this work as there is no estimation or reporting of diamonds or other gemstones in this project.

Intercepts Table for Dokwe Area

Intercepts calculated with 0.5g/t Au cut-off grade and minimum 1m composite length, allowing for up to 1m internal dilution (down hole widths).
